# Animal Shelter in 2060

Animal shelters today are great, but they also have a lot of problems. By 2060, I believe that there will be many improvements helping problems like euthanization, dirty conditions, and lack of adequate food and water.

First of all, euthanization is a big problem in many shelters. To fix this problem, we will make shelters bigger so that we have more space for more animals. We will also have a shot called Old-B-Gone, which will make an animal that is old for its breed five years younger. Obviously, you cannot use this on a five year old or younger. This is a good idea because it will keep animals that are old and will be euthanized from dying. I call it *Youthanization*.

Next, dirty conditions are another big problem in shelters. In 2060, we will have a robot called Bob the Robot, or BTR for short. The BTR will clean all the cages and play equipment while the animals are on a daily walk. They will also clean all the floors and walls. This will be an efficient and somewhat cheap way to keep shelters clean for the animals and employees.

Finally, lack of adequate food and water is another problem. In order to solve this problem, we will have citizens of a ten mile radius donate food and water to the shelter. It will be free for the shelter, and they can focus on buying new toys and equipment instead of food and water.

As you can see, Old-B-Gone, the BTR, and citizen donation of food and water will be efficient ways to solve euthanization, dirty conditions, and lack of food and water. I hope that in 2060, some of these dreams will come true.
